Bhavesh Shrimali

Contact Information

B150, Newmark Civil Engineering Laboratory
University of Illinois Urbana-Champaign

: bhavesh.shrimali@gmail.com
: bhaveshshrimali.github.io

Research Interests

Computational and Applied Math; Numerical Analysis; High Performance Computing; Nonlinear Variational Problems; Scientific ML; Finite Elements

Education

University of Illinois Urbana-Champaign **4.0/4.0**

- MS and Ph.D., Computational Mechanics, 2015-present
  Advisor: Prof. Oscar Lopez-Pamies
- Minor: Computational Science and Engineering, 2016-present

Indian Institute of Technology Guwahati **9.22/10.00**

- B.Tech, Civil Engineering, 2011-15
- *Ranked* 1st *in the department*

Publications

[J2] **Bhavesh Shrimali** and William J. Parnell and Oscar Lopez-Pamies. A simple explicit model constructed from a homogenization solution for the large-strain mechanical response of elastomeric syntactic foams. *International Journal of Nonlinear Mechanics*, 2020 [**pdf**]

[J1] **Bhavesh Shrimali** and Victor Lefèvre and Oscar Lopez-Pamies. A simple explicit homogenization solution for the macroscopic elastic response of isotropic porous elastomers. *Journal of the Mechanics and Physics of Solids*, 122:364 – 380, 2019 [**pdf**]

Awards & Achievements

- **Travel Fellowship**: Awarded to present research work at **WCCM-ECCOMAS, 2020** [*'15*]
- **Outstanding TA** Ranked as an excellent TA for Structural Mechanics [*'17,'19*]
- **Institute silver medal**, IIT Guwahati: Ranked first in the graduating class [*'15*]
- **DAAD-WISE fellowship**: Awarded to roughly 150 Indian undergraduates to pursue a research intern in Germany [*'14*]
- **IET India Scholarship**: Awarded to about 170 students from select universities based on a nationwide scholastic exam [*'14*]
- **HKUST IIP**: Selected for the International Internship Program (IIP) to pursue a summer research internship at HKUST, Hong Kong [*13*]
- **OPJEMS**:Among the top 50 students selected from all over India for the scholarship [*'13*]
- **Dhrishti 2012**, India: Among the *top 5* teams who proposed novel engineering solutions to renewable energy for meeting India's energy needs [*'12*]
- **Institute Merit Scholarship**, IIT Guwahati: Awarded annually to the top ranked student in each department based on year round academic performance [*'12-'15*]
- **Indian National Olympiads**: Selected for the Indian National Olympiads in Mathematics, Physics and Astronomy [*'11*]
- **KVPY Fellow**: Ranked among 209 students from all over the country [*'10*]
- **NTSE Scholar**: Secured an All India Rank (AIR) of 324/1000 [*'07*]

Technical Skills

Languages: Python, C++, Julia, Fortran

Finite Element Libraries: FEniCS, Firedrake, scikit-FEM, GridAP.jl

Distributed Computing: MPI, OpenMP, CUDA, OpenCL

Miscellaneous: Bash, Git, PyCUDA, pybind11, **Legate-NumPy**

Computational Projects

Solving Nonlinear PDEs using Deep Learning [*2020-*]

Implementing a coupled framework with finite elements (in space) and deep neural networks (in time) to solve nonlinear PDEs arising in viscoelasticity and fracture. The overarching goal is to develop an optimally convergent and efficient framework that can describe and predict the nucleation and propagation of fracture in heterogeneous (dissipative) material systems when subject to arbitrary loading in space and time.

Numerical Homogenization of Multiscale PDEs [*2016-2019*]

Guide: Oscar Lopez-Pamies, (CEE) UIUC [**code**]

Implemented parallel, stable and robust finite element (FE) discretizations to solve second order nonlinear variational problems on periodic manifolds arising in mechanics. Recent work involved coupling these with fifth order *time*-explicit-integration algorithms to solve PDEs in nonlinear viscoelasticity. All the algorithms were implemented in the open source FE framework **FEniCS** and the resulting system of nonlinear algebraic equations were solved via canned solvers in **PETSc**. The numerical schemes were optimally convergent (in time and space) as well as conformal to an approximate asymptotic analysis.

Non-Conforming Finite Elements for Biharmonic Problems [*2018-2020*]

Guide: Oscar Lopez-Pamies, (CEE) UIUC [**ongoing**]

Implemented and solved the biharmonic plate-equation describing the small deformation response of perforated plates. Implemented a non-conforming FE discretization using the optimally convergent Morley-finite element basis with Nitsche's technique to impose free boundary conditions. The FE assembly was performed using a vectorized FE code written in **scikit-FEM** which builds on top of NumPy. The long term plan is to accelerate the FE code on GPUs via the distributed computing features offered by NVIDIA's **Legate-NumPy**

Multigrid Finite Elements in Hyperelasticity [*Fall-2018*]

Guide: Luke Olson, (CS) UIUC

Implemented a vectorized FE code (in NumPy) to simulate the response of hyperelastic materials over a range of physical properties. This work was done in collaboration with Tejaswin Parthasarathy.

Teaching

- CEE 598: Constitutive Modeling
- CEE 471: Structural Mechanics [Excellent TA.]
- CS 125: Introduction to Computer Science
- CEE 570: Finite Element Methods
- CS 357: Numerical Methods

Research Internships

Technische Universität Braunschweig [*Summer '14*]

Advisor: Prof. Dr. Klaus Thiele

I worked on linear perturbation analysis of a cable stayed bridge to identify the dominant eigen-modes. Subsequently, based on a FE analysis of the galloping cables, I proposed an optimum location of an eddy current damper. The entire set of calculations were done in FE simulation program ANSYS.

Hong Kong University of Science and Technology [*Summer '13*]

Advisor: Prof. Christopher K Y Leung I worked on tuning the proportion of elastomeric and steel fibres in high performance concrete to enhance the post peak softening response. I also worked on validating a FE analysis of a notched beam subject to 3-point bending with the in situ experiments.

Courses

Fast Algorithms and Integral Equations, Multigrid Methods, Nonlinear Finite Elements, Generalized Finite Element Method, Numerical methods for PDEs, Computational Inelasticity
